Standard Duty Flat Track System

Flat Track is an alternative to our standard "V" groove track. The Flat Track maintains the standard features of our "V" groove track and incorporates the same ease of installation. The Flat Track is manufactured with a low profile and tapered sides eliminating tripping hazards and making it easy for carts and other equipment to be moved in and out of the aisle. The Standard Duty Flat track is ADA compliant and is available with our built-in In-Track Anti-Tip feature.

Standard Flat Track is 2-1/8" wide, less than 1/2" at its highest point and is made from heat treated aluminum. It has a flat steel insert that is 5/8" wide in place of the "V" groove. This will reduce debris in the track. There is no adjustability within the track for this style but this track can be leveled through shimming. This track can be used with the standard flat track carriage.

Standard Flat Track Carriage is used primarily in retail applications, such as shoes, apparel, and handbags and in lighter applications of open filing systems in office environments. The maximum carriage length for the heavy duty manual carriage is 12' with a weight capacity of 3,000 lbs. per carriage.

Heavy Duty Flat Track System

Heavy Duty Flat Track has replaced the standard "V" groove track for large, heavier applications. The Heavy Duty Flat Track maintains the standard features of our "V" groove track and incorporates the same ease of installation. It is manufactured with a low profile and tapered sides eliminating tripping hazards and making it easy for carts and other equipment to be moved in and out of the aisle. The Heavy Duty Flat track is available is ADA compliant and is available with our built-in In-Track Anti-Tip feature.

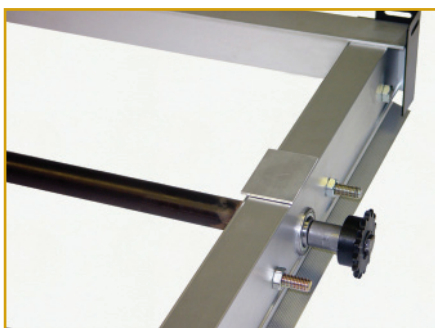

Heavy Duty Flat Track is 3 1/4" wide, less than 1/2" at its highest point and is made from aluminum. It has a flat steel insert that is 3/4" wide. This track will eliminate debris in the groove. There is no adjustability within the track for this style but this track can be leveled through shimming. This track can be used with the heavy duty flat track carriage and the mechanical assist carriage.

Heavy Duty Flat Track Carriage is used in applications similar to that of the standard duty carriage. However, as the materials become denser in weight, such as cosmetics, home furnishings, or "knock down" furniture, the heavy duty family is the product of choice. Larger filing and record storage applications will also utilize the heavy duty carriage. The maximum carriage length for the heavy duty manual carriage is 12' with a weight capacity of 3,000 lbs. per carriage.

Mechanical Assist Carriage permits larger carriage loads to be moved with minimal effort. The system is applicable when carriage weights exceed 3,000 lbs. The drive shaft allows movement of entire carriage with just a turn of the handle. The shaft runs the entire length of the carriage therefore eliminating "lag time" and "racking". The maximum system length is 24' with an overall weight capacity of 1000 lbs. per linear foot of carriage.

All track is ADA compliant unless otherwise stated. All track is cut to specific lengths based on the project. Denstor carriages require a track under each shelving upright.
